

CLAIMS

What is claimed is:

- 5 1. An apparatus for managing data for a wireless device, comprising:
a first memory for storing received data of a wireless device;
a second memory for storing a network operational file, said operational file
consisting of instructions for selecting a destination using a wireless module of said
wireless device, and
10 instruction means for operating the network operational file for sending the
received data using the wireless module to the selected destination.
2. The apparatus of Claim 1, wherein the first and second memories are located
on the wireless module.
- 15 3. The apparatus of Claim 1, wherein the network operational file can be
configured for the wireless device and the selected destination.
4. The apparatus of Claim 1, wherein the instruction means automatically can
20 send the received data when the first memory means exceeds a predetermined
threshold.
5. The apparatus of Claim 1, wherein the instruction means can send the received
data in real time to a selected destination.
- 25 6. The apparatus of Claim 1, wherein the host can send data via the wireless
module to the wireless device.

7. The apparatus of Claim 6, further comprising:

wherein the host can send data in real time via the wireless module to the wireless device.

5 8. The apparatus of Claim 1, wherein the wireless device being a digital camera, PDA, laptop, MP3 player, or a wireless flash memory device.

9. The apparatus of Claim 1, further comprising:

wherein the wireless device connectable to an ISDN, Cellular or DSP network.

10

10. The apparatus of Claim 1, further comprising:

wherein the wireless module being intergrated into the wireless device.

11. A system for managing data in a wireless device, comprising:

15

a wireless module;

at least one source of data stored in a memory module of said wireless module;

a configuration means coupled to the memory module; and

wherein said configuration means transferring the stored data to a host device

20

having an external memory location at a predetermined point.

12. The system of Claim 9, wherein the configuration means selecting a default web address or user selected web address to transfer the stored data.

25 13. The system of Claim 9, wherein the memory size being in the order of 32k bytes, 64k bytes, 128k bytes, or 256k bytes.

14. The system of Claim 9, wherein the predetermined point is determined by the amount of data in the memory module.

30

15. The system of Claim 9, wherein the predetermined point is determined by the availability of the host device to receive the stored data.
16. The system of Claim 9, wherein the configuration means containing a user selected file for the wireless device and host destination.
17. The system of Claim 9, wherein the configuration means enabling bi-directional data flow between the host and the wireless device.
18. The system of Claim 9, wherein the configuration means enabling real time data to be received or sent for the wireless device to the host.
19. The system of Claim 9, wherein the host being a base station device coupled via a router storage server having the external memory location.
20. A method for managing data for a wireless device, comprising:
storing received data in a first memory of a wireless device;
storing a network operational file in a second memory of a wireless module of the wireless device;
instructing an operational file consisting of instructions for selecting a destination using a wireless module, and
operating by the instruction means the network operational file for sending the received data using the wireless module to the selected destination.
21. The method of Claim 20, wherein the first and second memories are located on the wireless module.
22. The Method of Claim 20, wherein the network operational file can be configured for the wireless device and the selected destination.
